Modern APIs for Single Sign-On, Authentication, and Access Management in the Hybrid Cloud World

Modern Web Access Management - how to architect your application's access management and single sign-on solution in a cloud/hybrid world using simple security APIs to achieve that magical goal of "Zero Trust".

Biography

Richard Sand created SSO/Rest™, a universal REST solution for SSO, authentication, and access management which protects critical systems both on-premises and in the Cloud. SSO/Rest's use of single library plugins means that it provides turnkey enforcement and integration to platforms, containers and servers. Prior to founding IDF Connect, Richard worked at IBM, with web access management pioneer Netegrity, and then for a decade as an IAM consultant for some of the world's largest enterprises.
